Installation Manual

Pre-Installation Notes

Note

- Due to ongoing research and product development, specifications, ratings, and dimensions are subject to change without notice. Refer to www.lifebreath.com for the latest product information.

Attention

- Do not apply electrical power to the unit until after the completion of the installation (including installation of low voltage control wiring).
- Ensure the installation and wiring is in accordance with all local electrical codes.
- Plug the unit into a standard designated (120 VAC) electrical outlet with ground.
- The use of an extension cord with this unit is not recommended. If the installation requires further wiring, have a licensed electrician make all the electrical connections. The recommended circuit is a separate 15 A/120 V circuit.

Caution

- Before installation, careful consideration must be given to how this system will operate if connected to any other piece of mechanical equipment, i.e., a forced air furnace or air handler, operating at a higher static. After installation, the compatibility of the two pieces of equipment must be confirmed, by measuring the airflows of the HRV, by using the balancing procedure found in this manual. Never install a ventilator in a situation where its normal operation, lack of operation or partial failure may result in the back drafting or improper functioning of vented combustion equipment
- Unit must be installed level to ensure proper condensate drainage. Due to the broad range of installation and operational conditions, consider the possibility of condensation forming on either the unit or connecting ducting. Objects below the installation may be exposed to condensate.
- Do not install control wiring alongside electrical wire.

Warning

- Disconnect the power from the unit before cleaning or servicing.
- To prevent electrical shock, it is extremely important to confirm the polarity of the power line that is switched by the safety (disconnect) switch. The hot line (black) is the proper line for switching. Use either a voltmeter or test lamp to confirm the absence of a voltage between the disconnect switch and ground (on the cabinet) while the door is open. This procedure must be followed, as dwellings are occasionally wired improperly. Always ensure the proper grounding of the unit.
- Improper installation, adjustment, alteration, service, or maintenance can cause property damage, personal injury or loss of life. Installation and service must be performed by a qualified installer or service agency.

Homeowners Warranty Information

After the installation is complete, fill out the Warranty Information page in the Homeowner's manual.

1 LOCATION NOTES

Install the unit in a heated space that provides clearance for service access. A typical location is in either a mechanical room or an area close to the outside wall within proximity to where the weather hoods are mounted. If a basement area is inconvenient or non-existent, install the unit in a utility room or laundry room.

Leave enough clearance at the front of the access door for servicing the air filters and core. The recommended clearance is a minimum of 25 in. (635 mm) for opening and closing the door. Four straps are provided with the unit for hanging it from the basement floor joists.

Attic installations are not recommended due to:

- The complexity of work to install
- Difficulty of access for servicing and cleaning
- Freezing conditions in the attic

If attic installation is necessary, the unit must be situated in a conditioned space.

Note: ENERGY STAR®

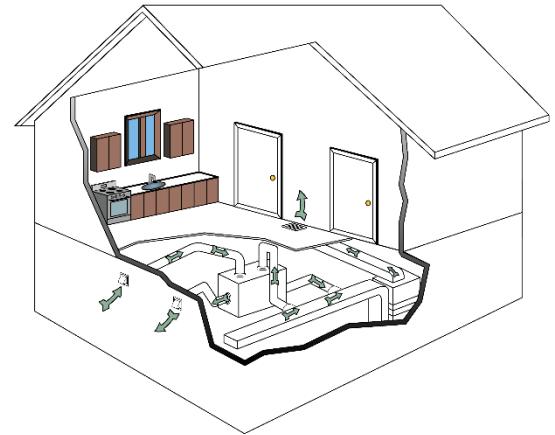

If the unit is certified ENERGY STAR®, the following applies:

- This product earned the ENERGY STAR® by meeting strict energy efficiency guidelines set by Natural Resources Canada and the US EPA. This product meets ENERGY STAR® requirements only when used in Canada.
- To ensure quiet operation of the ENERGY STAR® certified H/ERV, each product model must be installed using sound attenuation techniques appropriate for the installation.
- The way your heat/energy-recovery ventilator is installed can make a significant difference to the electrical energy you use. To minimize the electricity use of the heat/energy-recovery ventilator, a stand-alone fully ducted installation is recommended. If you choose a simplified installation that operates your furnace air handler for room-to-room ventilation, an electrically efficient furnace that has an electronically commutated (EC) variable speed blower motor will minimize your electrical energy consumption and operating cost.
- Installation of a user-accessible control with your product model will improve comfort and may significantly reduce the product model's energy use.

2 SIMPLIFIED INSTALLATION (RETURN/RETURN METHOD)

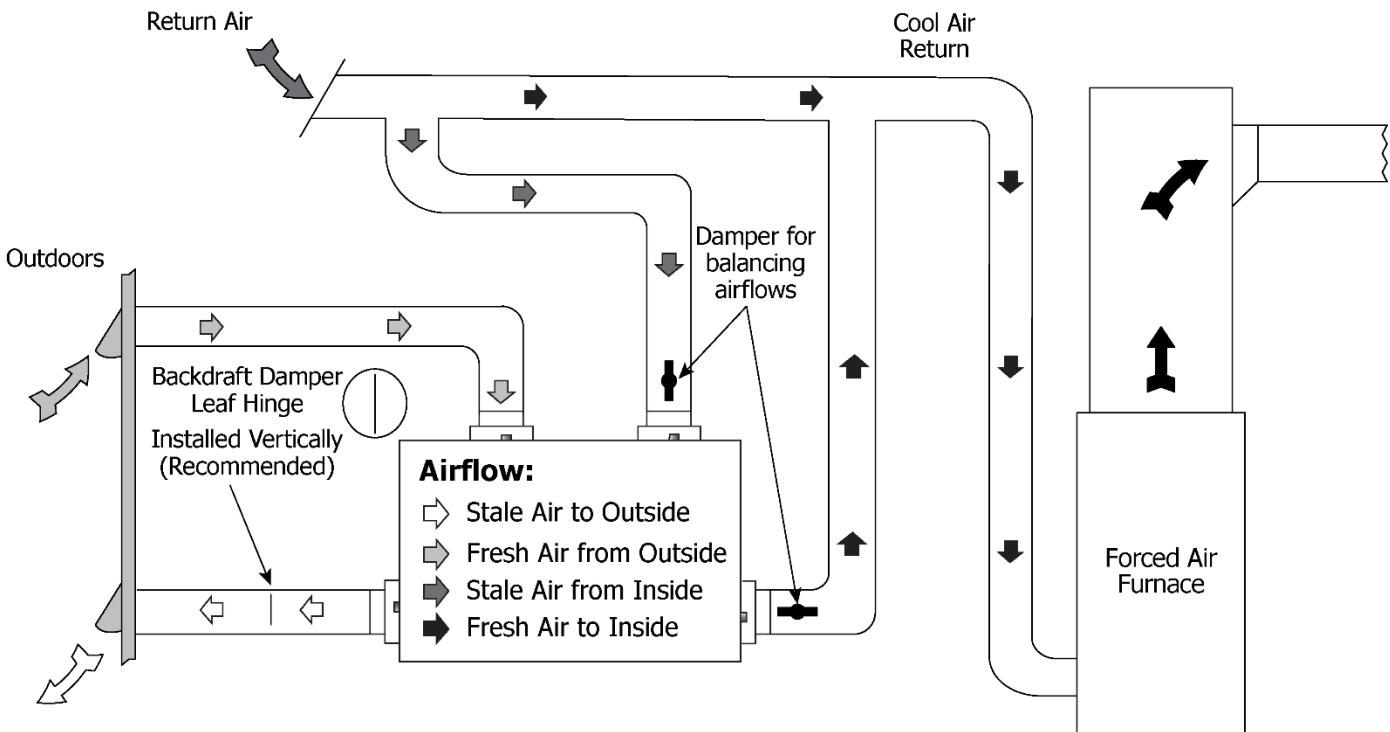

Installation Notes:

- The HRV must be balanced.
- Unit should be balanced on high speed with the furnace blower on.
- It is mandatory that the furnace blower run continuously or HRV operation be interlocked with the furnace blower.
- The duct configuration may change depending on the HRV model.
- A backdraft damper is recommended in the exhaust air duct to prevent outdoor air from entering the unit.
- The airflow must be confirmed on site using the balancing procedures found in this guide.

Spring-Loaded Backdraft Damper (recommended):

Install the Backdraft Damper with the leaf hinge vertical. The damper is installed on the "Stale Air to Outside" Collar.

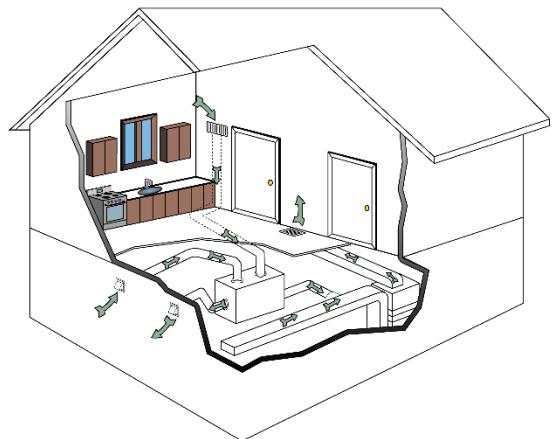

Warning

- Check local codes/authority having jurisdiction for acceptance.
- Applications such as greenhouses, atriums, swimming pools, saunas, etc. have unique ventilation requirements which should be addressed with an isolated ventilation system.
- Weatherhood arrangement is for drawing purposes only. Check local codes/authority having jurisdiction for acceptance.
- Backdraft dampers are recommended for the stale air to outside air duct. This damper prevents outdoor air from entering the HRV during the operation of the furnace/air handler while the HRV is in standby, off, or recirculating.

3 PARTIALLY DEDICATED SYSTEM INSTALLATION

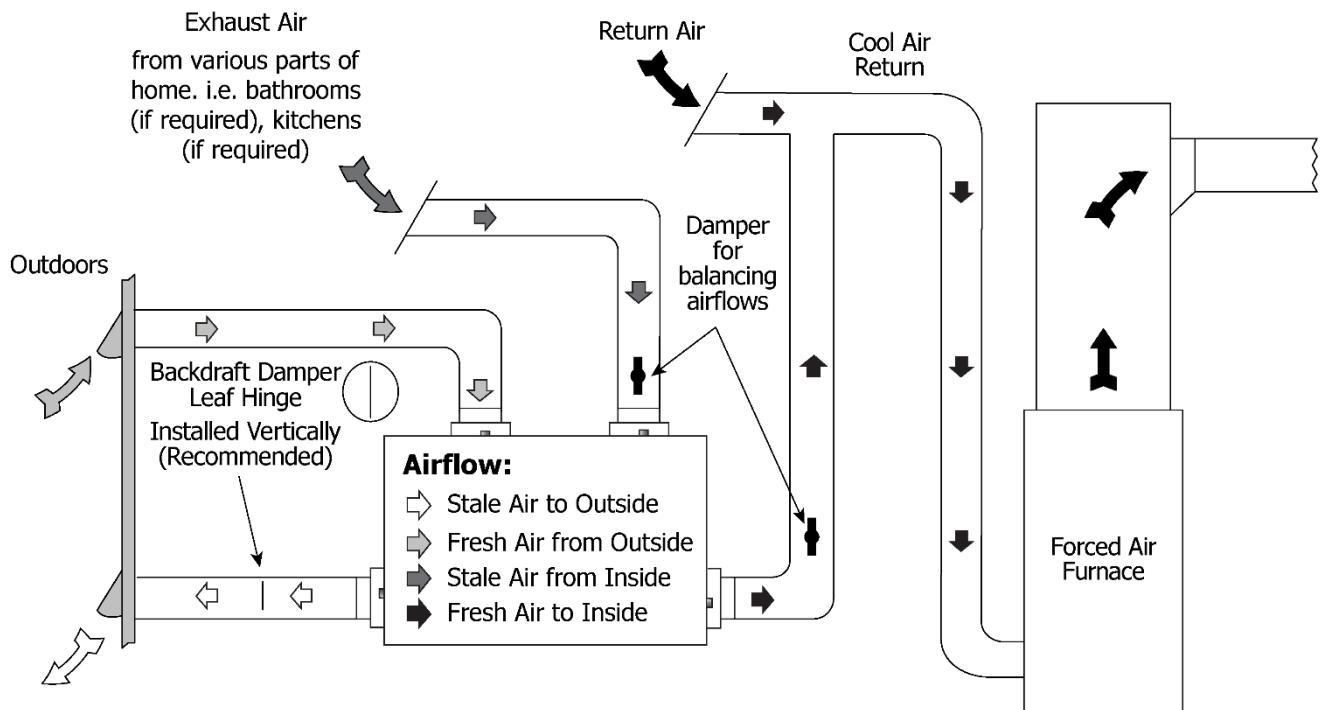

Installation Notes:

- The HRV must be balanced.
- Unit should be balanced on high speed with the furnace blower on.
- It is recommended that the furnace blower run continuously or HRV operation be interlocked with the furnace blower. Refer to building code.
- The duct configuration may change depending on the HRV model.
- A backdraft damper is recommended in the exhaust air duct to prevent outdoor air from entering the unit.
- The airflow must be confirmed on site using the balancing procedures found in this guide.

Spring-Loaded Backdraft Damper (recommended):

Install the Backdraft Damper with the leaf hinge vertical. The damper is installed on the "Stale Air to Outside" Collar.

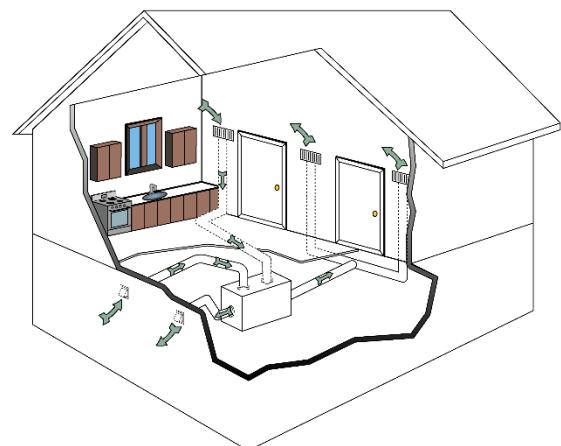

Warning

- Check local codes/authority having jurisdiction for acceptance.
- Applications such as greenhouses, atriums, swimming pools, saunas, etc. have unique ventilation requirements which should be addressed with an isolated ventilation system.
- Weatherhood arrangement is for drawing purposes only. Check local codes/authority having jurisdiction for acceptance.
- Backdraft dampers are recommended for the stale air to outside air duct. This damper prevents outdoor air from entering the HRV during the operation of the furnace/air handler while the HRV is in standby, off, or recirculating.

4 FULLY DEDICATED SYSTEM INSTALLATION

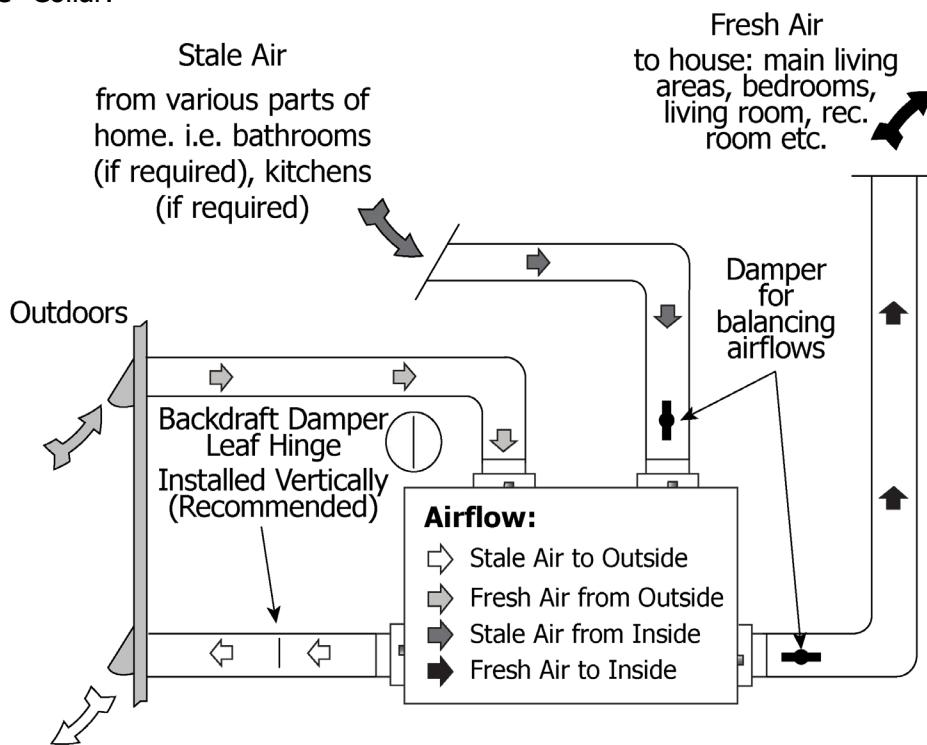

Installation Notes:

- The HRV must be balanced.
- When balancing, all external exhaust systems should be turned off (i.e., range hood, exhaust, bathroom vents).
- All exhausting appliances should have their own make-up air, as this is not an intended use for the HRV system.
- The duct configuration may change depending on the HRV model.
- The airflow must be confirmed on site using the balancing procedures found in this guide.

Spring-Loaded Backdraft Damper (recommended):

There is a location for an optional Backdraft Damper with the leaf hinge vertical. The damper is installed on the "Stale Air to Outside" Collar.

Warning

- Check local codes/authority having jurisdiction for acceptance.
- Applications such as greenhouses, atriums, swimming pools, saunas, etc. have unique ventilation requirements which should be addressed with an isolated ventilation system.
- Weatherhood arrangement is for drawing purposes only. Check local codes/authority having jurisdiction for acceptance.
- Backdraft dampers are recommended for the stale air to outside air duct. This damper prevents outdoor air from entering the HRV during the operation of the furnace/air handler while the HRV is in standby, off, or recirculating.

5 OPTIONAL DUCT CONFIGURATIONS (195DCS)

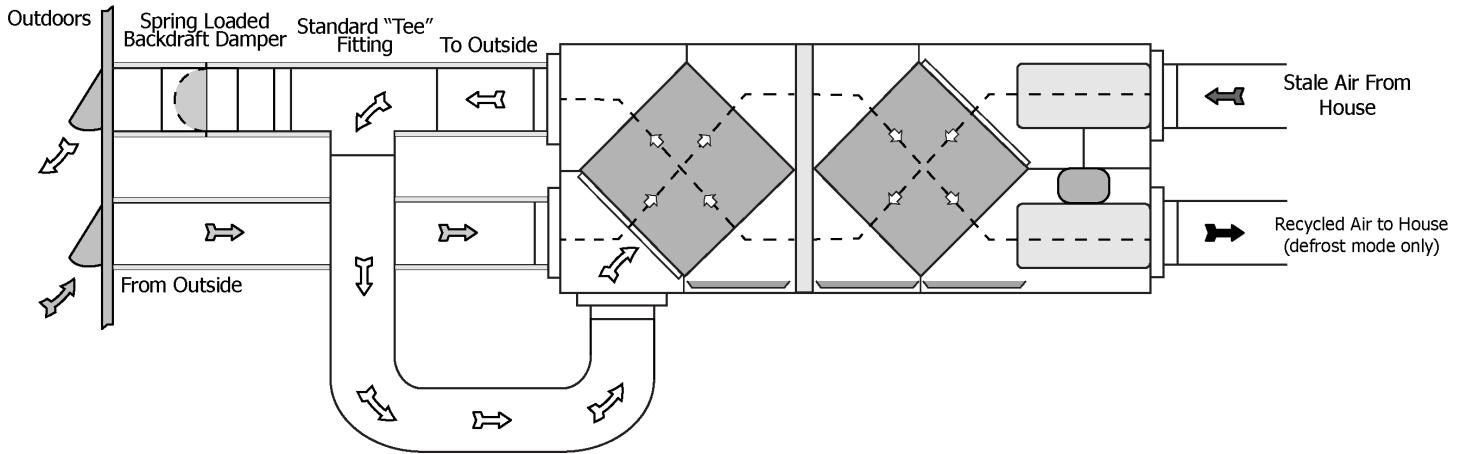

Figure A

Note: DIP Switch #2 must be set to "ON" position to activate recirculation if this configuration is applied. See [Installer Selectable High Speed Settings](#) for more information.

Attention

- Use Figure A ducting configuration to make a non-recirculating defrost unit operate as a recirculating defrost unit.

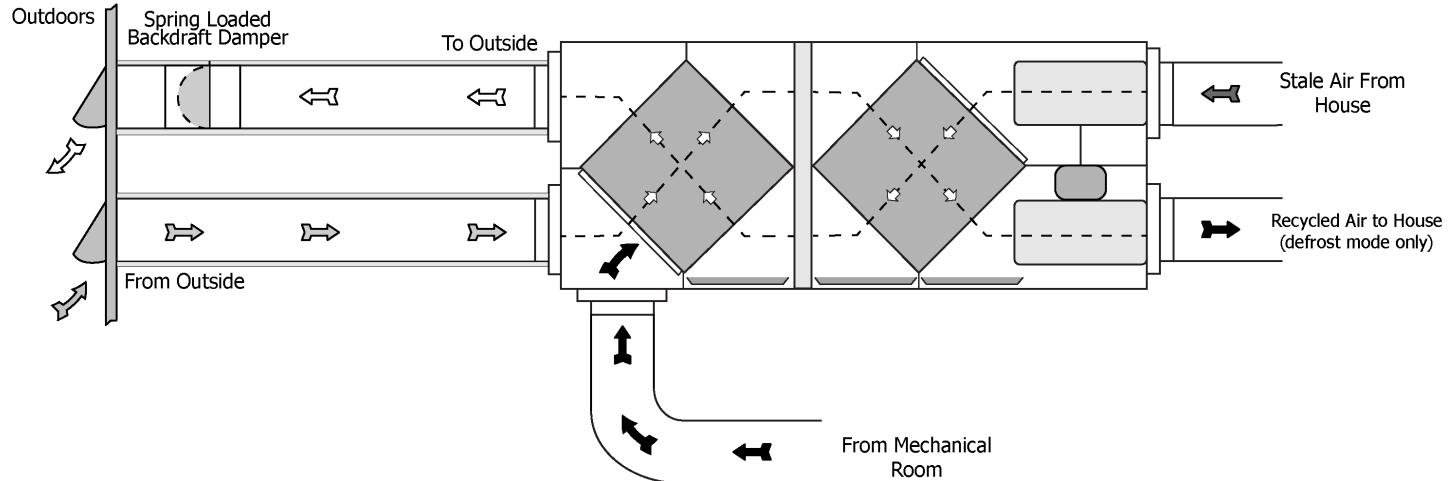

Figure B

Note: DIP Switch #2 must be set to "ON" position to activate recirculation if this configuration is applied. See [Installer Selectable High Speed Settings](#) for more information.

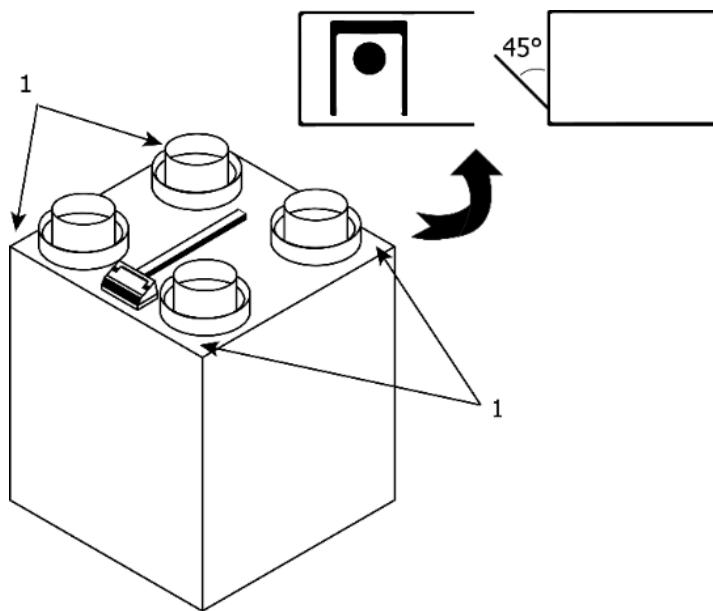

Attention

- Use Figure B ducting configuration to avoid negative pressure from being built up in the mechanical room during the defrost cycle.

6 MOUNTING (RNC4-TPD / -TPF)

Mounting the RNC4-TPD and RNC4-TPF:

(1) Mounting Points

1. Locate the four mounting tabs on the left and right sides of the unit, at the front and back.
2. Using a flat head screwdriver, bend out the four tabs to approximately 45 degrees.
3. Once the tabs have all been bent outwards, insert the "S" hooks through the four holes on the tabs.
4. Install the unit to the structure. Refer to [Hanging Straps](#).

Attention

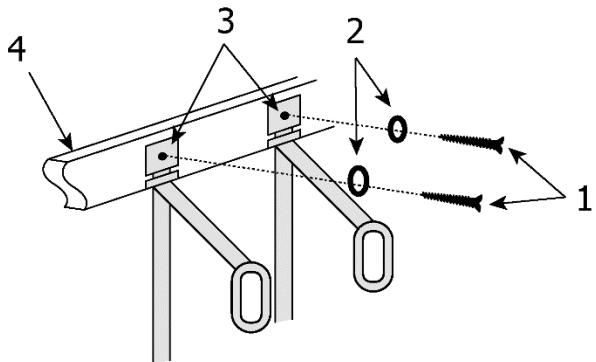

- Do not drill additional holes in the HRV

7 HANGING STRAPS

The hanging straps are designed to reduce the possibility of noise, resonance, and harmonics.

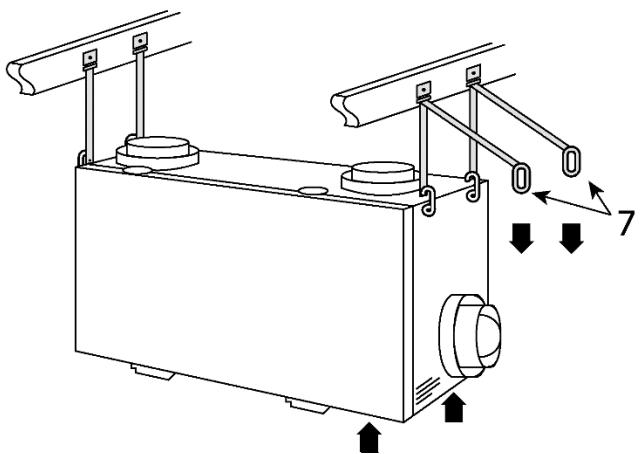

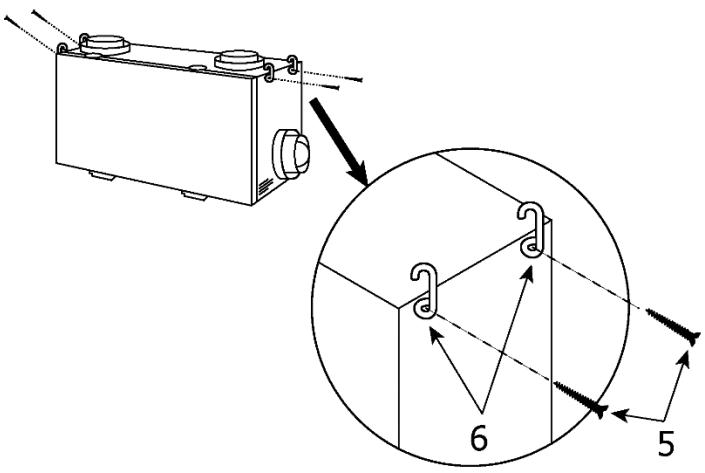

Figure Callouts:

- (1) Screws (not included)
- (2) Washers (not included)
- (3) Hanging Strap Grommets
- (4) Structure
- (5) Machine Screws
- (6) "S" Hooks
- (7) Hand Loops

Installation Steps:

1. Insert 4 screws and 4 washers (not included) through the hanging strap grommets. Fasten to the structure.
2. Remove the 4 machine screws located on the upper side of the unit. Attach the "S" hooks and reinsert the machine screws.
3. Hook the bottom grommets of the straps through the "S" hooks. Pull down vertically on the hand loops while lifting the bottom of the unit.
4. Level the unit from right to left to right and front to back. Adjust the unit up by pulling down vertically on the hand loops while lifting on the bottom of the cabinet.
5. Fold the excess strap of the hand loops and secure with a zip tie.

Attention

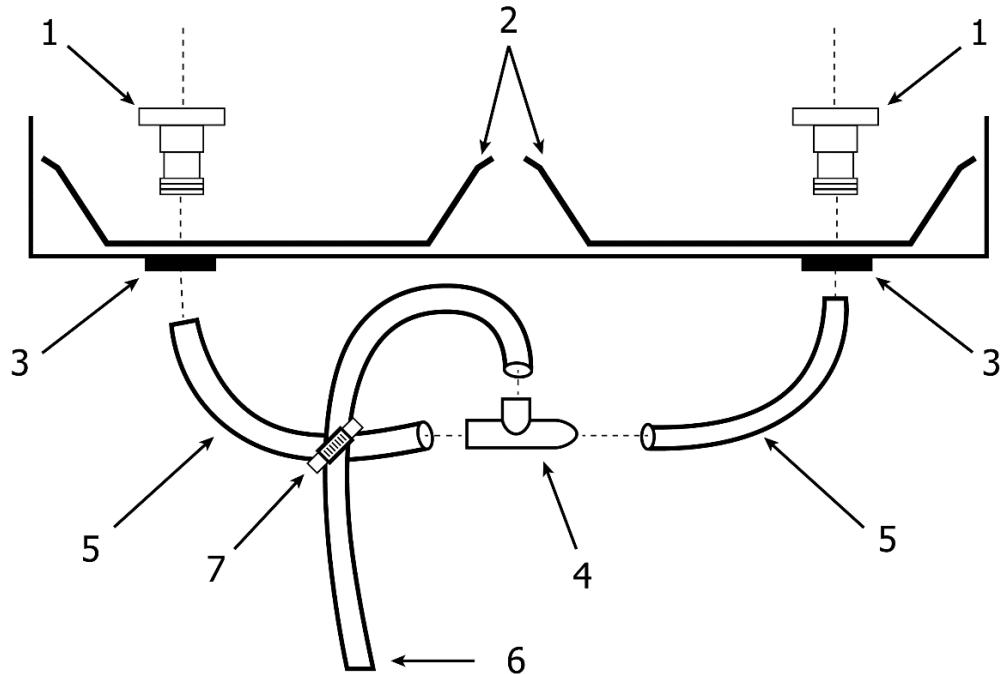

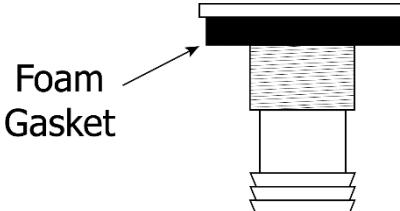

- The washer must be wider than the eyelet of the grommet on the hanging strap.
- Must push up on the bottom of the HRV when pulling the hanging straps.
- The unit must be mounted level for proper drainage of the condensate pans.

8 DRAIN CONNECTION

The HRV cabinet has pre-punched holes for the drain. The HRV may produce some condensation during a defrost cycle. This water should flow into a nearby drain or be taken away by a condensate pump.

Figure Callouts:

- (1) Drain Spout
- (2) Drain Pan
- (3) Nut
- (4) Tee Connector
- (5) 1/2 in. Drain Hose
- (6) Drain Line
- (7) Zip Tie

Installation Steps:

1. Insert the drain spout through the hole in the drain pan. For the RCN4-TPD/TPF units, use the drain spout with the foam gasket only.
2. Install nut and washer on the drain spout. Tighten the nut. For the RCN4-TPD/TPF units, hand-tighten the nut only.
3. Construct a P-trap using the plastic tee connector.
4. Cut two lengths of 1/2 in. drain hose (not included) and connect the ends to the two drain spouts and the other ends to the plastic tee connector.
5. Position the tee connector to point upward and connect the drain line. Use a zip tie to secure the drain line to one of the 1/2 in. drain hoses.
6. Tape or fasten base to avoid any kinks.
7. Pour a cup of water into the drain pan of the HRV after the drain connection is complete. This creates a water seal which will prevent odours from being drawn up the hose and into the fresh air supply of the HRV.

Caution

- The HRV and all condensate lines must be installed in a space where the temperature is maintained above the freezing point or freeze protection must be provided.
- Drain trap and tubing must be below bottom of door with 1/4 in. per foot downwards slope away from unit.
- Under certain conditions, a secondary drain pan may be required to protect from condensate leakage.

9 GRILLES

Installation Notes:

Adjustable grilles should be used to balance the flow rates into and out of various rooms. The grilles should not be adjusted after balancing the unit.

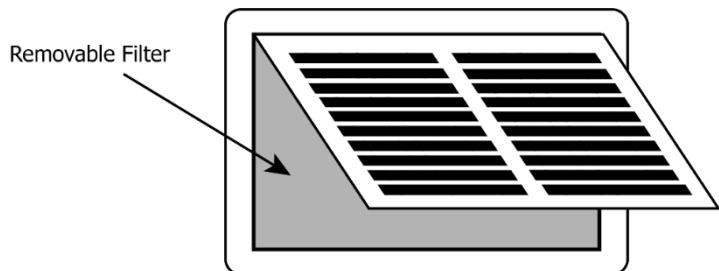

Grilles or diffusers should be positioned high on the wall or in the ceiling. Kitchen exhaust should never be connected to the range hood. They should be installed at least 4 ft (1.2 m) horizontally away from the stove.

Field supplied balancing dampers should be installed external to the unit to balance the amount of stale air being exhausted with the amount of fresh air being brought into the house. Refer to airflow balancing section.

The Kitchen Grille

The Kitchen Grille includes a removable grease filter. Most building codes require that kitchen grilles are equipped with washable filters.

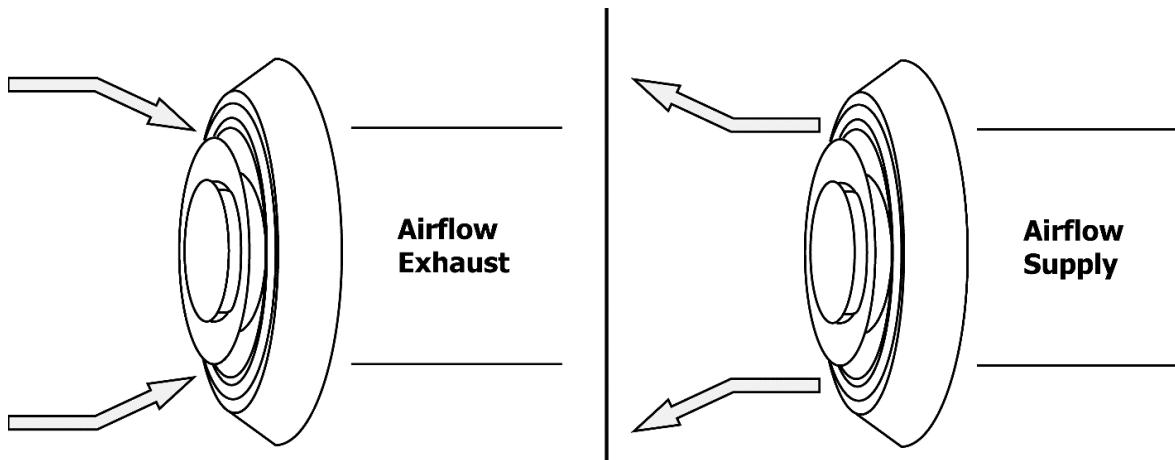

- Part# 99-10-002, 6 in x 10 in

The TechGrille

The TechGrille is a round, fully adjustable grille, which provides quiet air distribution.

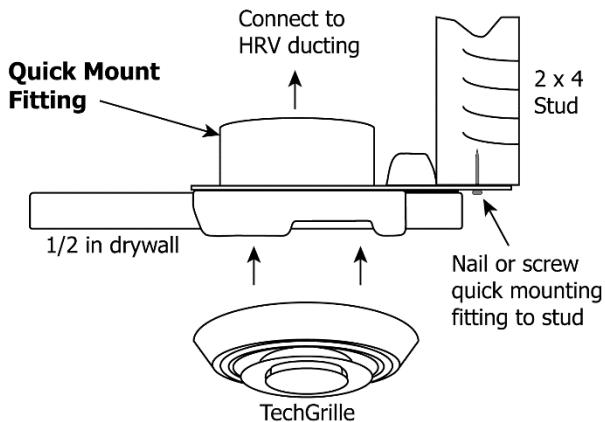

- Part # 99-EAG4, 4 in (100 mm)
- Part # 99-EAG5, 5 in (125 mm)
- Part # 99-EAG6, 6 in (150 mm)
- Part # 99-EAG8, 8 in (200 mm)

10 GRILLE FITTINGS

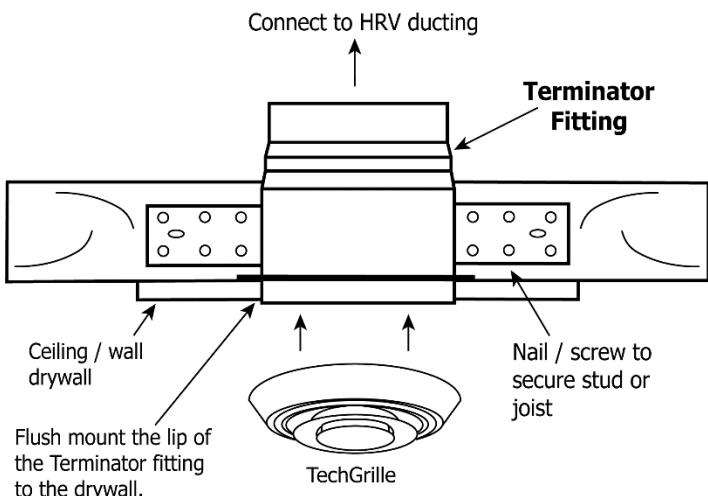

Quick Mount Fitting (Part# 99-QM6)

- Use this rough-in fitting before the drywall is installed.
- Nail fitting onto the stud.
- Available size: 6 in.

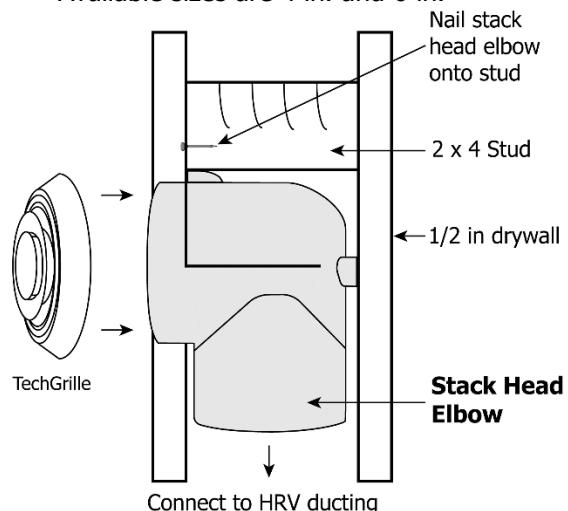

Terminator Fitting (Part# 99-TM 4/5/6)

- Use this rough-in fitting before the drywall is installed.
- Nail or screw fitting onto the stud or joist.
- Available sizes: 4 in, 5 in, and 6 in.
- Adapts to ridged and flex ducting
- Strong attachment for grilles, either vertically or horizontally.

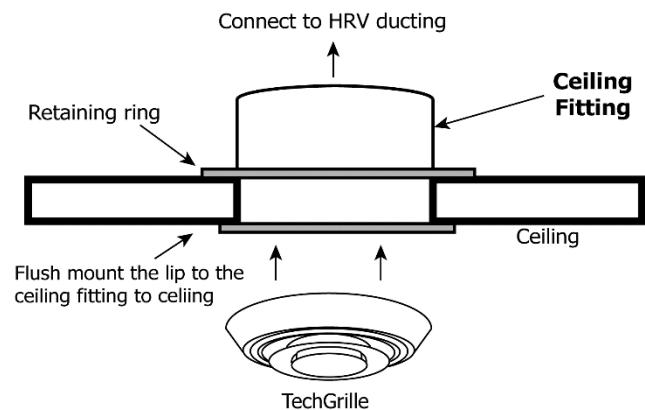

Stack Head Elbow (Part# 99-WF 4/6)

- Use this rough-in fitting before the drywall is installed.
- This fitting is ideal for running ducting through 2 x 4 (min.) studded walls.
- Nail to stud.
- Available sizes are 4 in. and 6 in.

Suspended Ceiling Fitting (Part# 99-CF6)

- Use this fitting for ceiling tiles or finished/installed drywall.
- Cut a hole through the ceiling tile, insert the fitting and use the retaining ring to hold the fitting in place.
- For finished/installed drywall, use caulking around the lip if you do not have access to attach the retaining ring.
- Available size: 6 in.

Caution

- Do not mount exhaust grille within 4 ft (1.2 m) (horizontally) of a stove to prevent grease from entering the unit.

11 LIFEBREATH WEATHER HOODS

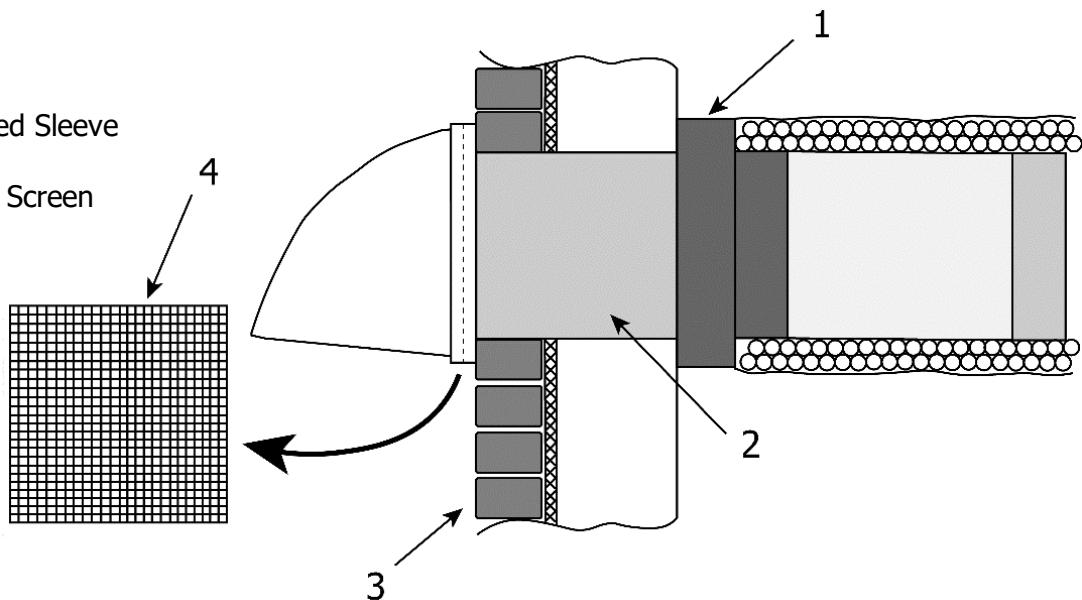

Fixed covered weather hoods have a built-in bird screen with a 1/4 in. (6 mm) mesh to prevent foreign objects from entering the ductwork.

Installation Notes:

- The inner and outer liners of the flexible insulated duct must be clamped to the sleeve of the weatherhoods (as close to the outside as possible) and the appropriate port on the HRV. It is very important that the fresh air intake line be given special attention to make sure it is well sealed. A good bead of high-quality caulking (preferably acoustical sealant) will seal the inner flexible duct to both the HRV port and the weatherhood prior to clamping.
- The flexible insulated duct that connects the two outside weatherhoods to the HRV should be stretched tightly and be as short as possible to minimize air flow restrictions.
- Twisting or folding the duct will severely restrict airflow.
- Hard (rigid) ducting which has been sealed and insulated should be used for runs over 10 ft (3.3 m). Refer to your local building code.

Figure Callouts:

- (1) Thermal Collar
(2) 12 in. long Galvanized Sleeve
(3) Exterior Wall
(4) 1/4 in. (6mm) Mesh Screen

Installation Steps:

- Thermal collar slides over galvanized sleeve to ensure vapor barrier is 100% sealed to wall plate.
- Fasten thermal collar to belt.
- Slide the insulated flexible ducting over galvanized sleeve and fasten it to the thermal collar.
- Weatherhood is hinged to allow for easy access for cleaning of mesh screen.

Attention

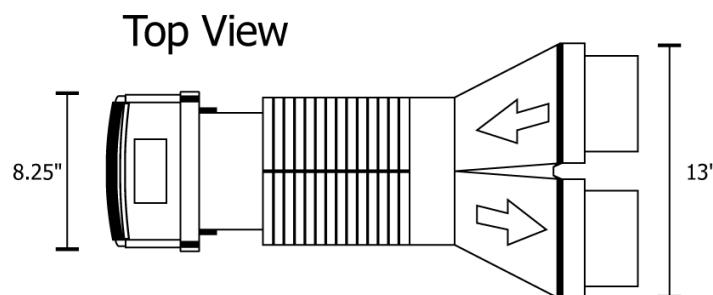

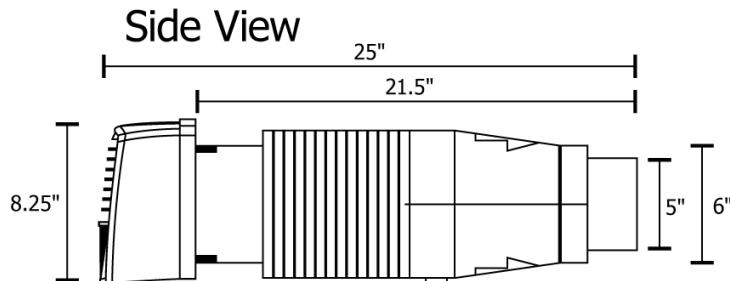

- Weather Hood Requirements:** Check local codes/authority having jurisdiction for acceptance and space requirements for weatherhoods. Do not locate in garage, attic, or crawl space.
 - i) Intake:** Should be located upstream (if there are prevailing winds) from the exhaust outlet. Not near dryer vents, furnace exhaust, driveways, oil fill pipes, gas meters, or garbage containers.
 - ii) Exhaust:** Not near a gas meter, electric meter or a walkway where fog or ice could create a hazard.

12 LIFEBREATH DUAL HOOD

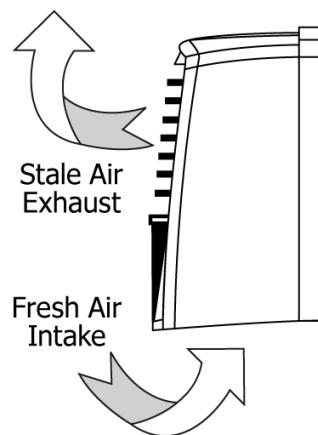

The Lifebreath Dual Hood only requires one 6 in. opening for intake and exhaust. The Lifebreath Dual Hood can be used up to a maximum airflow of 140 cfm.

Available Units:

- 99-194 – 4 in. Dual Hood (not shown)
- 99-190 – 5-6 in. Dual Hood

Side View of Hood and Backplate

Caution

- Sealant must be applied as per instructions or leakage and condensation may occur.
- Insulate the Fresh Air Supply and Stale Air Exhaust duct work back to the unit.

Attention

- Contact your local building authority before installation of the Dual Hood to verify compliance with local building codes.

Note

- Tested by: National Research Council Canada
- Program: Building Regulations for Market Access Report Number: A1-007793
- Report Date: 15 February 2016
- Found to comply with requirement as set in the NBC.

13 MAIN CONTROL INSTALLATION (99-DXPL02)

The 99-DXPL02 main control must be surface mounted onto a wall. Only one main control should be installed into a ventilation system.

Installation:

1. Remove the operating instructions card from the top of the main control (figure A).
2. Carefully separate the face plate and the back plate by firmly pulling it apart (figure A).
3. Position the back plate of the control in the desired location on the wall and mark the wall for the desired screw holes (figure B).
4. Remove the back plate from the wall and mark the hole for the wires in between the two screw holes (figure B).
5. Drill two holes for the screws and wall anchors and drill one hole for the wires in between the two screw holes (figure B).
6. Pull the 3 wire 20 gauge (min.), 100 ft length (max.), through the opening in the wall.
7. Connect the wires to the R, G, and Y terminals on the back plate (figure B).
8. Using the two supplied screws and anchors, install the back plate on the wall.
9. Attach the face plate to the back plate (figure A).
10. Install the operating instructions card in the top of the main control (figure A).
11. Connect the 3 wires 20 gauge (min.), 100 ft length (max.), to the 3 (RED), 4 (YEL), and 5 (GRN) terminals located on the HRV terminal block (figure C).

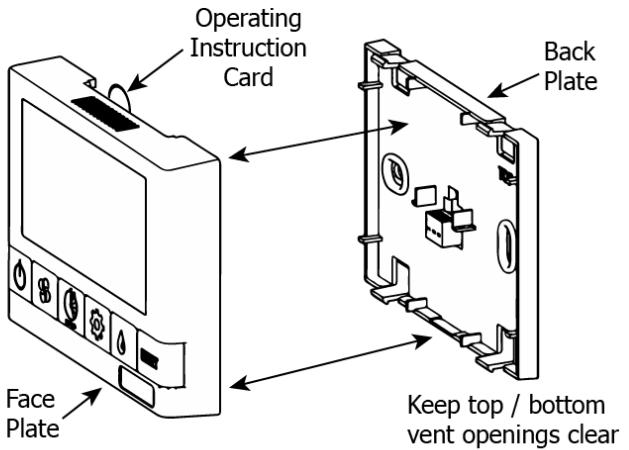

Figure A

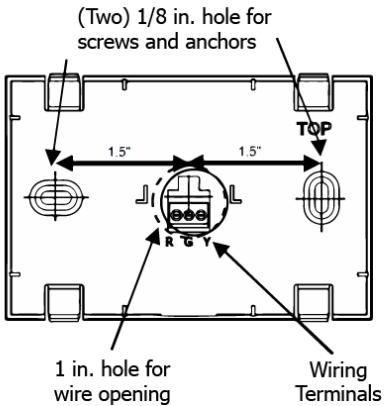

Figure B

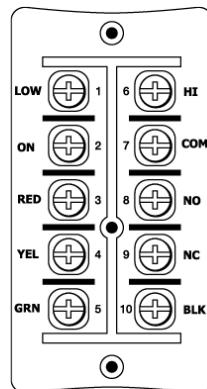

Figure C

Attention

- Use care when separating or attaching the face plate to avoid damaging the contact pins.

14 MAIN CONTROL INSTALLATION (99-BC02/3/4)

The 99-BC02, 99-BC03, 99-BC04 ventilation controls may either be installed onto a flush mounted electrical switch box or surface mounted onto a wall. Only one main control should be installed into a ventilation system.

Installation:

1. Carefully separate the face plate and the back plate by firmly pulling it apart. Keep the top/bottom vent openings clear (figure A).
2. Position the back plate in the desired location on the wall and mark the wall for the desired screw holes (figure B).
3. For mounting the main control without a Decora plate, break off the top and bottom tabs than position the back plate in the desired location on the wall and mark the wall for the desired screw holes (figure C)
4. Remove the back plate from the wall and mark the hole for the wires centered between the two screw holes (figure B or C).
5. Drill two 1/8 in. holes for the screws and wall anchors and drill one 1 in. x 0.75 in. hole for the wires.
6. Pull the 3 wire 20 gauge (min.), 100 ft length (max.), through the opening in the wall.
7. Connect the wires to the R, G, and Y terminals on the back plate (figure B or C).
8. Using the two supplied screws and anchors, install the back plate on the wall.
9. Attach the face plate to the back plate (figure A).
10. Connect the 3 wires 20 gauge (min.), 100 ft length (max.), to the 3 (RED), 4 (YEL), and 5 (GRN) terminals located on the HRV terminal block (figure D).

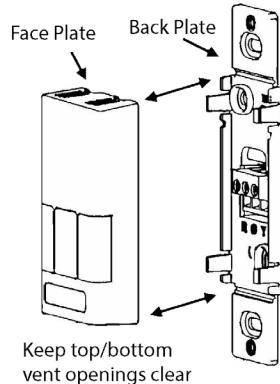

Figure A

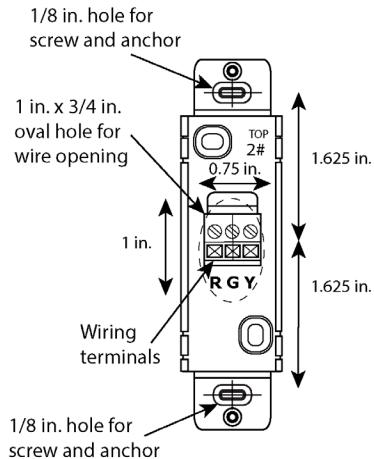

Figure B

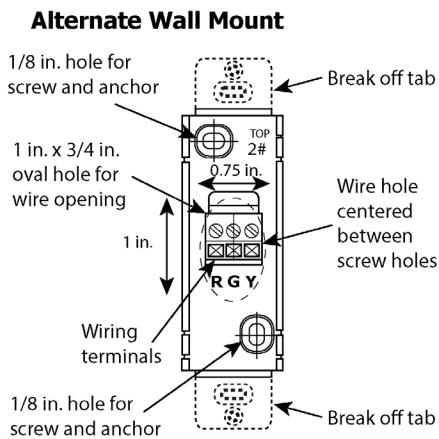

Figure C

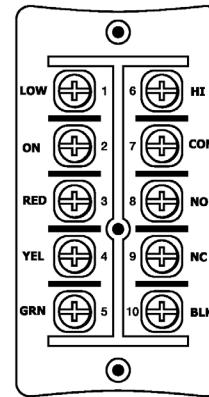

Figure D

Attention

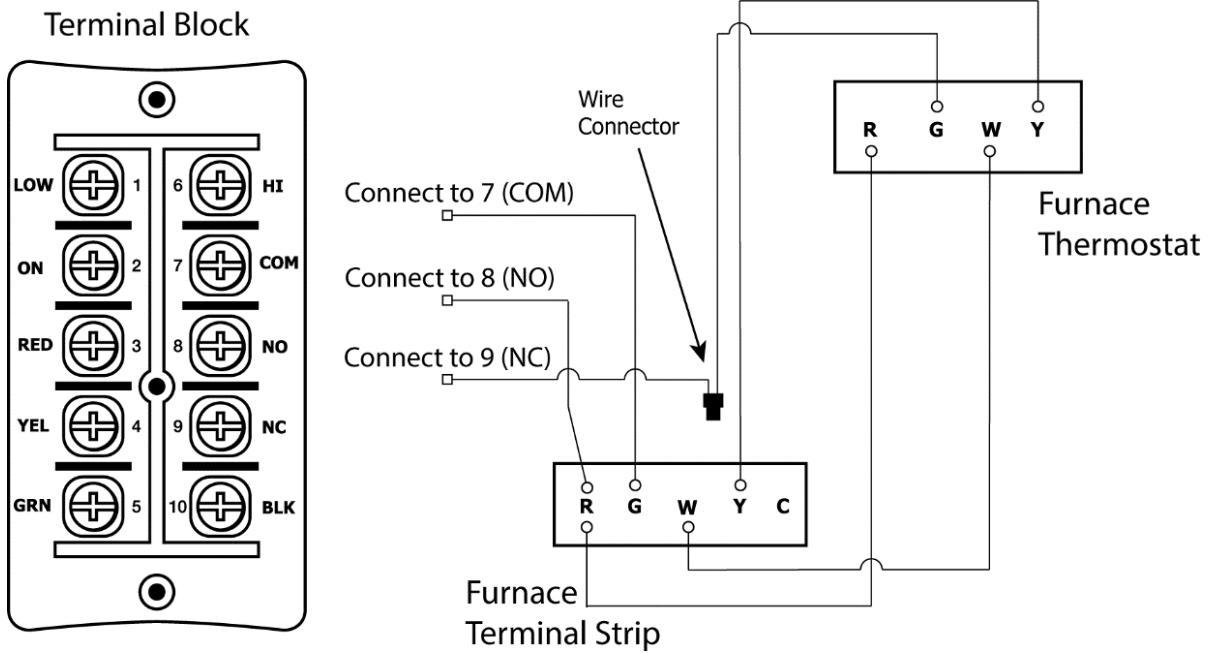

- Use care when separating or attaching the face plate to avoid damaging the contact pins.

15 INTERLOCKING THE HRV

Interlocking the HRV to a Furnace/Air Handler

Connecting the HRV as shown below will ensure that the air handler/furnace blower motor is operating whenever the HRV is venting.

- The HRV must be interlocked to the furnace/air handler with a [Simplified Installation \(Return/Return Method\)](#).
- The HRV should be interlocked to the furnace/air handler with a [Partially Dedicated System Installation](#).

Caution

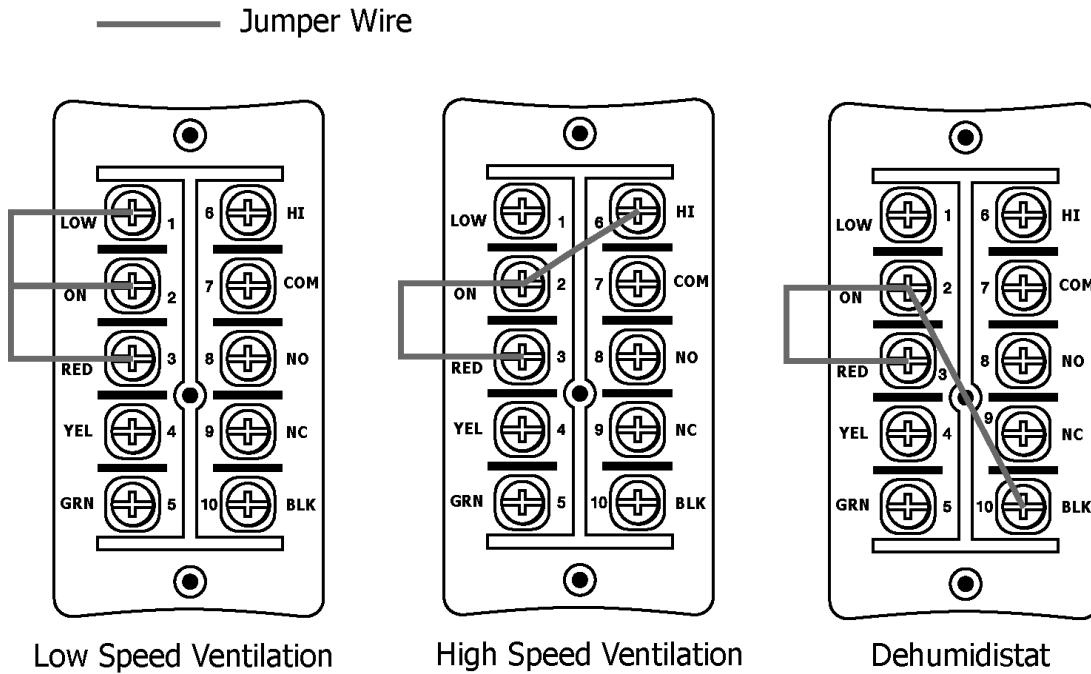

- Consideration should be given to competing airflows when connecting the HRV in conjunction with an air handler/ furnace blower system.

16 ADDITIONAL CONTROLS

Setting "Standby" When Using the Main Control

The HRV will be "fully-off" when selected on the main control. Timers and/or other controls will not function when the HRV is in off position.

The "fully-off" feature can be modified to "standby-off" by adding a jumper on the HRV terminal block between 2 (ON) and 3 (RED) terminals. "Standby" can also be achieved by setting the main control to the on position and selecting speed 0. Timers and/or additional controls will initiate high speed ventilation when activated.

Adding Dry Contact Controls

A jumper must be placed between 2 (ON) and 3 (RED) terminals on the HRV terminal block to activate the HRV for timers and/or dry contact controls, or if installing the unit without a main control. Jumpers can be added between terminals on the HRV terminal block for additional controls, per the table below:

Setting	Terminals	
Low Speed Ventilation	2 (ON)	1 (LOW)
High Speed Ventilation	2 (ON)	6 (HI)
Dehumidistat	2 (ON)	10 (BLK)

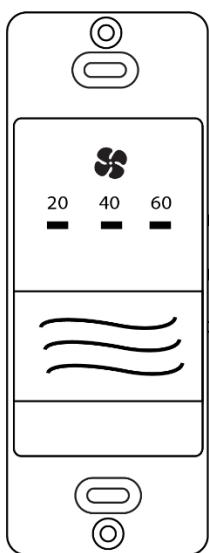

Caution

- Building codes in some areas require "fully-off" functionality. Check with your local building authority before modifying the unit to "standby-off". Unintentional operation of the HRV by the end user may occur if the unit is modified from "fully-off" to "standby-off".

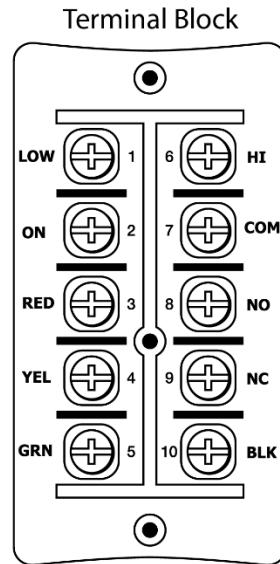

17 TIMERS

20/40/60 Minute Timer (99-DET01)

Connect the wires from the Y, R, and G terminals on the timer to the 4 (YEL), 3 (RED), and 5 (GRN) terminals on the HRV terminal block as shown.

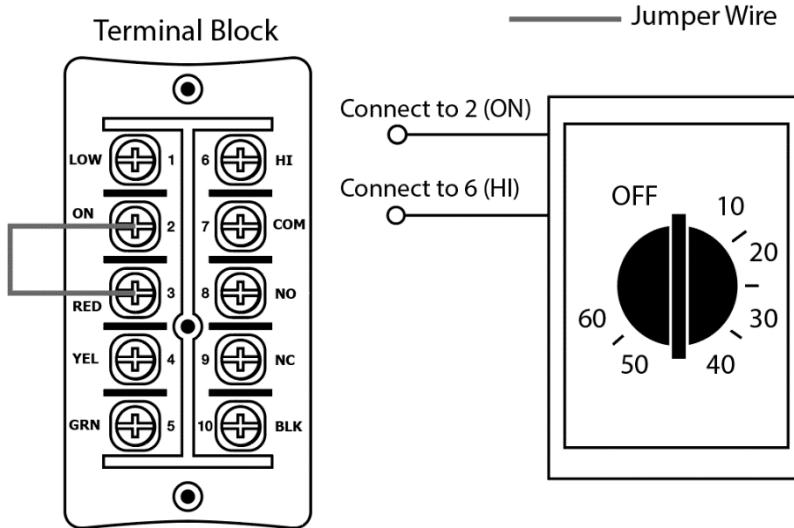

- Y —— □ Connect to 4 (YEL)
- R —— □ Connect to 3 (RED)
- G —— □ Connect to 5 (GRN)

Mechanical Timers Installation (99-101)

The Mechanical Timer is a 2 wire "dry contact" timer. Connect a jumper wire between the 2 (ON) and 3 (RED) terminals on the HRV terminal block and connect the two timer wires to the 2 (ON) and 6 (HI) terminals on the HRV terminal block as shown.

Attention

- Timers mount in standard electrical boxes.
- Use 3 wire 20 gauge (min.) 100 ft length (max.) low voltage wire and multiple timers individually wired back to the unit.

17 TIMERS

Wireless 20/40/60 Minute Timer (99-DET02)

The timers may be installed onto a flush mounted electrical switch box or it may be surfaced mounted onto a wall.

Pairing:

1. Remove the battery from the back of the timer, if installed.
2. Press the ON/OFF Button  on the main control to turn it on.
3. **DXPLO2:** Press the left and right buttons ( and ) simultaneously on the main control. The screen will go blank, and the wireless symbol  will appear flashing on the bottom right of the display. This indicates that the main control is now in pairing mode.
4. **BC02, BC03, or BC04:** Press the left and right buttons ( and  or ) simultaneously on the main control. The bottom row LEDs will begin flashing. This indicates the main control is now in pairing mode.
5. Keep the timer within 16 in. of the main control when pairing.
6. Install the battery into the remote timer. The four lights will immediately flash five times. The red battery light will remain on for 12 seconds, then the 40 minute status light will flash. The 20, 40, and 60 minute status lights will flash for up to 30 seconds and then stop.
7. Press the Power Button  on the main control to exit pairing mode.
8. Press the Select Button on the timer to test that pairing was successful (figure A).
 - If the HRV initiates HIGH fan speed ventilation, pairing was successful.
 - If the HRV does not initiate HIGH fan speed ventilation, pairing was not successful. Un-pair the timer and return to step 1 of the pairing procedure and restart the pairing process.
9. Pair additional timers as necessary by repeating steps 1 through 8.

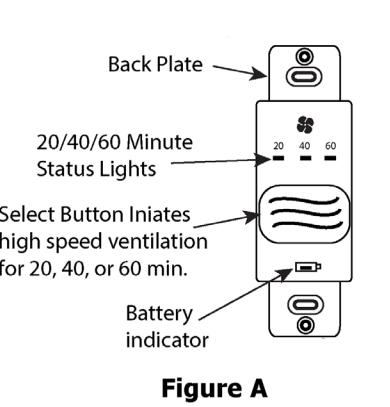

Figure A

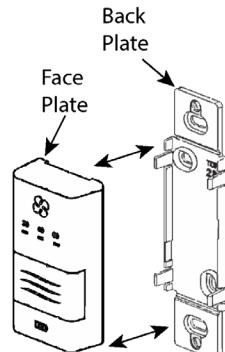

Figure B

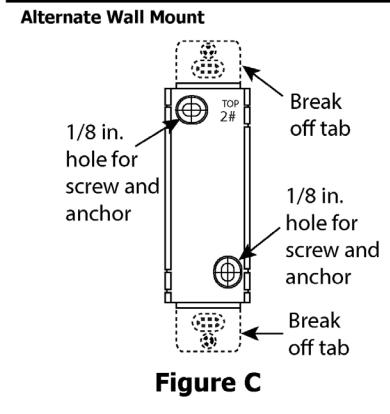

Figure C

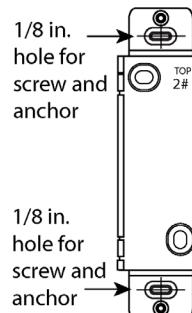

Figure D

Un-pairing:

1. Remove the battery from the back of the timer.
2. Press and hold the Select Button on the front of the timer (figure A).
3. While holding the Select Button, reinstall the battery in the timer. Continue holding the Select Button until the 20, 40, and 60 minute status light begins flashing (this can take up to 30 seconds). The timer will now be unpaired with the main control (figure A).

Installation:

1. Separate the face plate from the back plate by firmly pulling apart (figure B).
2. For mounting the main control without a Decora plate, break off top and bottom tabs (figure C).
3. Place the back plate of the main control in the desired location on the wall and pencil mark the top and bottom screw holes. Drill two 1/8" holes (figure C or D).
4. Attach the back plate to the wall using the two supplied screws and anchors.
5. Attach the face plate to the back plate (figure B).

Attention

- The wireless timers and repeaters must be paired to the main control of the HRV. This process is called "Pairing". Multiple timers and repeaters can be paired to the main control.

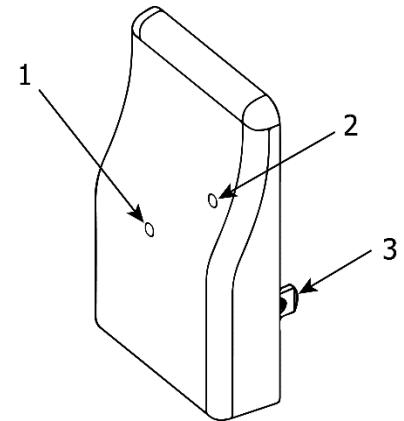

18 REPEATER

99-RX02 Repeater

- (1) Green LED
- (2) Red LED
- (3) Power Plug

The wireless repeater is used to extend the range of the 99-DET02 wireless timers. The repeater plugs directly into a 120V power outlet. The 99-RX02 repeater wirelessly connects to the main control as well as the 99-DET02 wireless timers.

The 99-RX02 repeater should be installed at the halfway point between the 99-DET02 wireless timer and the main control if the timer is out of range. The LED will indicate the repeater's connection strength to the main control per the table below. Re-adjust the repeater's position as necessary.

LED Colour	Connection	Action
Solid Green	Good	No further adjustments are required.
Flashing Green	Moderate	The repeater will function properly but shouldn't be moved further away from the main control.
Red	Bad	The repeater needs to be moved closer to the main control.

Pairing:

1. Turn on the main control by pressing the ON/OFF button .
2. **DXPL02 control:** Press the left and right buttons simultaneously on the main control ( and ). The screen will go blank, and the wireless symbol will appear flashing on the bottom right of the display. This indicates that the main control is now in pairing mode.
3. **BC02, BC03 or BC04 control:** Press the left and right buttons simultaneously on the main control ( and  or ). The bottom row LED's will begin flashing. This indicates that the main control is now in pairing mode.
4. The RX02 Repeater must be powered within 16 in. of the main control for pairing. If an outlet is not available an extension cord should be used to power the Repeater initially for pairing.
5. Plug the repeater into the power outlet. The green light will flash after approximately 12 seconds indicating that the repeater is paired with the main control.
6. Press the ON/OFF button  on the main control to exit pairing mode and the repeater may now be unplugged and moved to its permanent location.
7. To pair additional repeaters with the same main control, repeat steps 1 through 5 until all repeaters have been paired.

 Attention
<ul style="list-style-type: none">• The repeaters are to be plugged directly into a 120V power outlet.

19 INSTALLER SELECTABLE HIGH SPEED SETTINGS

Adjusting the DIP Switches

The circuit board on this unit has adjustable DIP switches for the selection of three different high speeds. The factory setting is Hi3. Refer to www.libreath.com for the specifications sheet particular to the unit.

DIP Switch settings

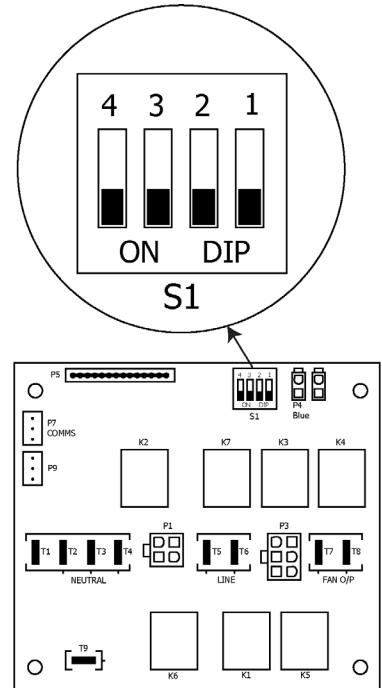

Speed	Switch			
	1	2	3	4

22 BALANCING THE AIRFLOWS

Balancing the airflows is critical to ensure that the amount of air coming into the building equals the amount of air exhausted to the outside of the building. If these two airflows are not properly balanced, the following issues may occur:

- A positive or negative pressure in the house
- HRV will not operate at its maximum efficiency
- HRV will not defrost properly.

Airflow Measuring Gauge:

- A digital manometer is a suitable instrument for the balancing of airflows.

Airflow Balancing Kit:

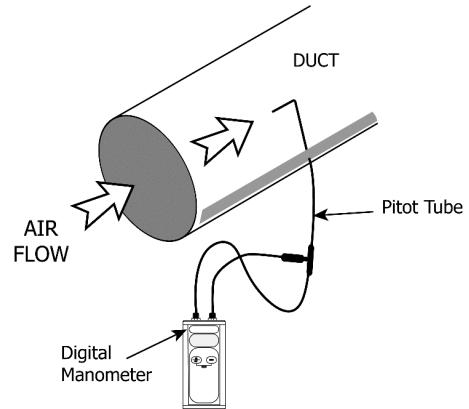

- Kit includes a digital manometer, pitot tubes, hose, adapters, and tool bag.

Airflow Balancing Kit (99-BAL-KIT)

Gauge Attachments:

When sampling an airflow, various attachments are available for use on a digital manometer. Consult with your Lifebreath distributor for available options such as a pitot tube, flow measuring station, and an airflow measuring probe. The illustration below shows a digital manometer with a pitot tube attachment. This combination will measure the system air velocity pressure accurately, regardless of the duct size or shape (either round or rectangular).

Balancing Preparation:

Prior to performing the air balancing procedure, perform the following steps:

1. Seal the ductwork.
2. Confirm the installation and proper operation of all the components of the HRV.
3. Fully open the balancing dampers.
4. Turn off all household exhaust devices (range hood, clothes dryer, bathroom fans).
5. Set the HRV at high speed.
6. Prior to balancing the unit, first adjust airflows in the branch lines to specific areas of the house.
7. If the outdoor temperature is below 0°C (32°F), ensure the unit is not running in defrost.
8. If the system is a Simplified or Partially Dedicated installation, operate the furnace/air handler at high speed.

Attention

- Continuous, excessive, positive pressure may drive moist indoor air into the external walls of the building. Once inside the external walls, moist air may condense (in cold weather) and degrade structural components or cause locks to freeze.
- Continuous, excessive, negative pressure may have several undesirable effects. In some geographic locations, soil gases such as methane and radon gas may be drawn into the home through basement or ground contact areas and may also cause the backdrafting of vented combustion equipment.

23 BALANCING THE AIRFLOWS

Determining the CFM:

After balancing the airflows, calculate the CFM flow rate.

Example

This example shows how to determine the airflow for a 6 in diameter duct. If the duct velocity pressure reads 0.025 in w.g. on the digital manometer, use the chart that came with the pitot tube to determine a duct velocity of 640 ft/min. for a duct velocity pressure of 0.025 in w.g.

CFM Calculation

CFM = feet per minute x cross section area of duct

$$= 640 \times 0.196$$

$$= 125$$

Cross section area of some common duct sizes:

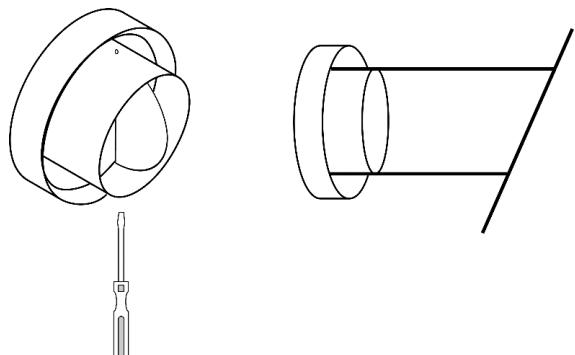

Cross-Section Area	Duct Size
0.087	4 in duct
0.139	5 in duct
0.196	6 in duct
0.267	7 in duct

Units with Balancing Collars:

Install these units with the dampers fully open and damper down the duct with the higher airflow equal to the lower airflow. All other units require dampers for balancing airflows installed into the "Fresh Air to Building" and "Stale Air from Building" ductwork.

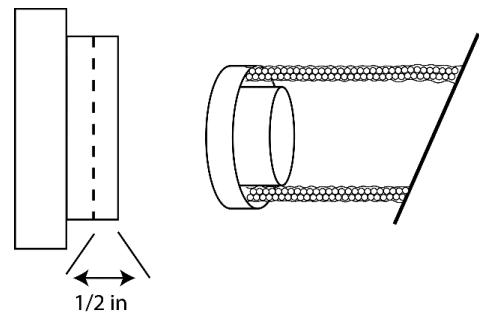

Hard/Rigid Ducting

- Push and turn with slotted screwdriver. Damper automatically locks when pressure released.

Insulated flexible ducting

- When connecting ductwork to the collar, take note where screws are located. Screws should be located no further than 1/2 in from outside edge of collar, so as not to impede operation of the damper.

Attention

- Installations where the HRV is ducted directly to the return of a furnace may require additional dampening on the fresh air to building duct. This is due to the high return static pressures found in some furnace installations.

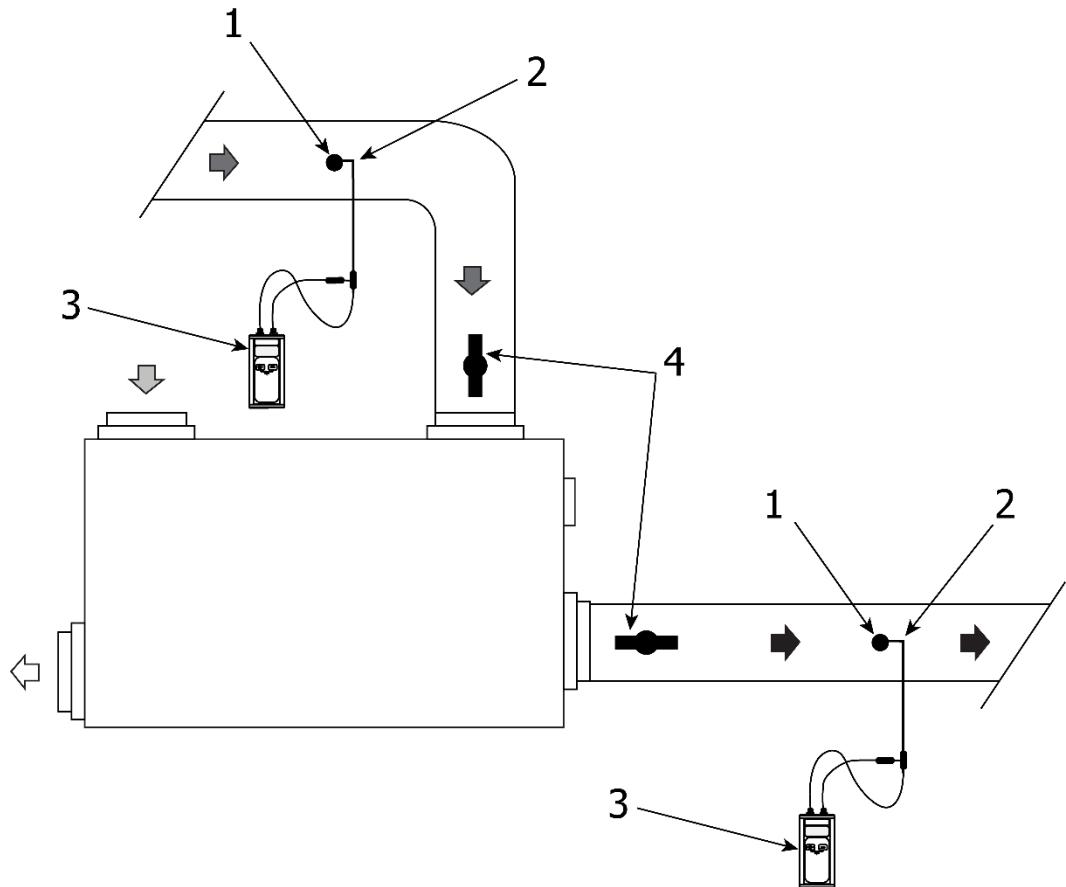

24 BALANCING THE AIRFLOWS – PITOT TUBE

Figure Callouts:

- (1) 3/16 in. Hole
- (2) Pitot Tube Tip
- (3) Digital Manometer
- (4) Balancing Damper

Airflow:

- ⇨ Stale Air to Outside
- ⇦ Fresh Air from Outside
- ⇨ Stale Air from Inside
- ⇨ Fresh Air to Inside

Steps:

1. Drill a 3/16 in. hole in the duct, ideally 3 ft. downstream and 1 ft. upstream of any elbows or bends in the fresh air and stale air streams.
2. Insert the pitot tube with the tip facing towards the air stream in the "Stale Air from Inside" stream. Move the pitot tube around in the duct (facing toward the airflow) and take an average reading. Record the reading.
3. Repeat Step 2 to measure the "Fresh Air to Inside" stream.
4. Review the readings and damper down the duct with the highest duct velocity pressure. Repeat Steps 2 and 3 until both ducts show identical readings. Upon completion of balancing, seal the holes with foil tape.

25 BALANCING THE AIRFLOWS – DOOR PORTS

Door balancing ports are designed to be used in the conjunction with a digital manometer to measure the stale and fresh airflows for balancing. Refer to [Door Port Locations](#) for your model to locate the door ports.

1. Prepare the airflow measuring device by connecting the hoses to the low- and high-pressure side of the gauge.
2. Insert the hoses into suitable rubber fittings (comes with 99-BAL-KIT). Use light pressure and rotate until fitting is snug. Do not extend the hose past the rubber fitting.
3. Open the HRV door. Remove the four door port covers by carefully pushing them out from the back side of the door.
4. Close the HRV door. Initiate power and operate the HRV on high speed. Operate the forced air system on high speed (if the HRV is connected to the forced air system).
5. Insert the 2 hoses from the gauge into the exhaust balance ports. Seal the supply balance ports with tape. Record your reading. If you get a negative reading, the hoses need to be reversed.
6. Insert the 2 hoses from the gauge to the supply balance ports. Seal the exhaust balance ports with tape. Record your reading. If you get a negative reading, the hoses need to be reversed.
7. Refer to [Airflow Charts](#) for your model to determine the supply airflow and exhaust airflow rates.
8. Damper down the higher airflow and repeat Steps 5 through 7 as required until both airflows are identical (balanced).
9. Remove the tape and hoses and reinstall the four door port covers.

38 TROUBLESHOOTING

Refer to the following table for troubleshooting the HRV unit.

Table 17.1 – Troubleshooting Procedures

SYMPTOM	CAUSE	SOLUTION
Poor airflows	<ul style="list-style-type: none">• 1/4 in (6mm) mesh on outside hood is plugged• Filters plugged• Core obstructed• House grilles closed or blocked• Dampers are closed if installed• Poor power supply at site• Ductwork is restricting HRV• Improper speed control setting• HRV airflow improperly balanced	<ul style="list-style-type: none">• Clean exterior hoods or vents• Remove and clean filter• Remove and clean core• Check and open grilles• Open and adjust dampers• Have electrician check supply voltage• Check duct installation• Increase the speed of the HRV• Have contractor balance HRV
Supply air feels cold	<ul style="list-style-type: none">• Poor location of supply grilles, the airflow may irritate the occupant• Outdoor temperature extremely cold	<ul style="list-style-type: none">• Locate the grilles high on the walls or under the baseboards, install ceiling mounted diffuse or grilles so as not to directly spill the supply air on the occupant (i.e., over a sofa)• Turn down the HRV supply speed. A small duct heater (1 kW) could be used to temper the supply air• Placement of furniture or closed doors is restricting the movement of air in the home• If supply air is ducted into furnace return, the furnace fan may need to run continuously to distribute ventilation air comfortably
Dehumidistat is not operating	<ul style="list-style-type: none">• Outdoor temperature is above 15°C (59°F)• Improper low voltage connection• External low voltage is shortened out by a staple or nail• Check dehumidistat setting it may be on OFF	<ul style="list-style-type: none">• Dehumidistat is functioning normally (see Auto Dehumidistat Disable in this manual)• Check that the correct terminals have been used• Check external wiring for a short• Set the dehumidistat at the desired setting
Humidity levels are too high condensation is appearing on the windows	<ul style="list-style-type: none">• Dehumidistat is set too high• HRV is not sized to handle a hot tub, indoor pool etc.• Lifestyle of the occupants Moisture coming into the home from an unvented or unheated crawl space• Moisture is remaining in the washroom and kitchen areas• Condensation seems to form in the spring and fall• HRV is set at too low a speed	<ul style="list-style-type: none">• Set dehumidistat lower• Cover pools, hot tubs when they are not in use• Avoid hanging clothes to dry, storing wood and venting clothes dryer inside. Firewood may have to be moved outside• Vent crawl space and place a vapor barrier on the floor of the crawl space• Ducts from the washroom should be sized to remove moist air as effectively as possible, use of a bathroom fan for short periods will remove additional moisture• On humid days, as the seasons change, some condensation may appear, but the homes air quality will remain high with some HRV use Increase speed of the HRV

39 TROUBLESHOOTING

Refer to the following table for troubleshooting the HRV unit.

Table 17.1 – Troubleshooting Procedures (cont.)

SYMPTOM	CAUSE	SOLUTION
Humidity levels are too low	<ul style="list-style-type: none">• Dehumidistat control set too low• Blower speed of HRV is too high• Lifestyle of occupants• HRV airflows may be improperly balanced	<ul style="list-style-type: none">• Set dehumidistat higher• Decrease HRV blower speed• Humidity may have to be added using humidifiers• Have contractor balance HRV airflows
HRV and/or ducts frosting up	<ul style="list-style-type: none">• HRV airflows are improperly balanced• Malfunction of the HRV defrost system	<div style="border: 1px solid black; padding: 5px;"><p>! Note</p><ul style="list-style-type: none">• Minimal frost build-up is expected on cores before unit initiates defrost cycle functions</div> <ul style="list-style-type: none">• Have HVAC contractor balance the HRV• Ensure damper defrost is operating during self-test
Condensation or ice buildup in insulated duct to the outside	<ul style="list-style-type: none">• Incomplete vapor barrier around insulated duct• A hole or tear in outer duct covering	<ul style="list-style-type: none">• Tape and seal all joints• Tape any holes or tears made in the outer duct cover, ensure that the vapor barrier is completely sealed.
Excess water in the bottom of the HRV	<ul style="list-style-type: none">• Drain pans plugged• Improper connection of HRV's drain lines• HRV is not level• Drain lines are obstructed• HRV heat exchange core is not properly installed	<ul style="list-style-type: none">• Look for obstructions in the drain line• Look for kinks in the drain line
Excessive Vibration	<ul style="list-style-type: none">• Dirt on fan wheels	<ul style="list-style-type: none">• Have contractor service HRV
